Monolithic Linear IC

Chroma Signal Processor for VHS VTR Use

**Overview**

The LA7330,7331N are small-sized, multifunctional ICs that contain VHS VTR chroma signal processing circuitry in shrink type DIP24S packages. Since the package is made so small as DIP24S and a minimum number of external parts is required, the LA7330,7331N occupy much less space on the board, thus facilitating VTR set design. The chroma section is made adjustment-free (except REC chroma level), thus streamlining VTR set manufacture. The LA7331N is opposite to the LA7330 in head switch pulse polarity. The LA7330M is a miniflat package version of the LA7330.

**Features**

- Designed for NTSC/PAL/MESECAM systems
- Adjustment-free chroma section (except REC chroma level)
- Small-sized package (DIP24S and MFP24S)
- Minimum number of external parts required
- LPF usable for REC/PB
- Multifunction

2f<sub>SC</sub> generator for CCD drive  
 Function to select APC loop input signal passed/not passed through comb filter  
 BGP output  
 3rd lock protector of VXO

\* 1 Free-running at ACC killer mode (no signal, B&W, weak input)

\* 2 For 2-head use, it is desirable to select "before COMB". (Pin 21 control)

1. The comb amp and SLD output resistor are connected externally.
2. In the MESECAM mode, the video signal does not pass through the comb filter, but is processed inside the IC.
3. In the REC mode, pin 23 functions as REC ACC output pin.
4. The input impedance of pin 24 (PB amp input) is approximately 11.5kΩ.
5. In the PB killer mode, pin 23 is brought to GND level.
